SWAN Systems was founded in 2016 to develop a solution for better water and nutrient management. Three founders designed a web-based, scalable product using a collective 70 years of business and farming experience. The SWAN Systems software helps customers make data-driven decisions about how much and when to irrigate, enabling you to apply the correct amount of water for optimal plant growth and yield. With a team of skilled individuals with extensive tertiary qualifications and agricultural experience, SWAN Systems mission is to help irrigators achieve their economic and environmental goals by providing the world's best irrigation and nutrient management tools.
